Project Communication

Phase 8: Project Demonstration

1. Purpose of Communication

Project communication should help a reviewer understand the user problem, what the application actually does, how the main workflow operates and which limitations remain. The explanation should be concise and consistent across the written report, live demonstration and any presentation slides.

2. Short Project Pitch

Trip Genius AI helps travellers turn trip preferences, dates and budget into a structured itinerary draft. It combines a React frontend, FastAPI backend, Groq-powered generation and Supabase persistence. Users can revisit saved trips, print an itinerary and open Google Maps searches for hotels and restaurants.

3. Audience-Specific Emphasis

For a general audience

Focus on the user journey: enter trip details, generate a plan, review costs and tips, save the result, and search for places externally. Avoid unnecessary framework terminology unless asked.

For a technical reviewer

Explain the frontend/API boundary, request validation, AI prompt and JSON parsing, database persistence and deployment. Show where credentials are configured and how errors are handled without exposing secrets.

For an evaluator

Describe the problem, objectives, working features, test evidence, constraints and future work. Make a clear distinction between implemented features and ideas planned for later.

4. Claims to Avoid

- Do not claim live hotel prices, verified ratings or availability.
- Do not claim guaranteed Jain/vegetarian food suitability based only on a search query.
- Do not claim booking or payment capability unless implemented and tested.
- Do not quote latency, accuracy or satisfaction scores without measurements.
- Do not say every feature passed unless test evidence exists.

5. Recommended Speaking Order

1. Introduce the project and planning problem.
2. Show the form and explain each input briefly.
3. Generate an itinerary and review the result.
4. Show Saved Trips and demonstrate opening or deleting a record.
5. Open the Hotels & Restaurants section and explain the Google Maps search behaviour.
6. Show print/save functionality.
7. Summarize architecture, limitations and future improvements.

6. Communication Quality

Use readable zoom, avoid rushing through long outputs, and explain what each action proves. If a live service fails during recording, use a prepared screenshot as supporting evidence and describe the issue honestly rather than presenting a failed action as successful.
