Demonstration of Proposed Features

Phase 8: Project Demonstration

1. Demonstration Goal

The demonstration should prove that the core user journey is connected and understandable. It should not simply show screenshots in sequence; it should show the user entering data, submitting a request, reviewing the result and using the persistence and external-search actions.

2. Feature Walkthrough

Home and trip form

Begin on the home page and point out the starting city, destination, dates, budget, traveller count, interests and travel style. Use a realistic test case and confirm the values before submitting.

Generate itinerary

Submit the form and wait for generation to complete. Show the summary and daily activity structure. Explain that estimated costs and suggestions are AI-generated and should be verified before travel.

Saved Trips

Show the saved-trip list. Open a previously generated trip to demonstrate retrieval. If deletion is included in the demo, use a disposable test trip and confirm that the list updates after deletion.

Hotels and Restaurants

Open the search section, choose a destination and food preference, and launch the Google Maps query. Explain that the app opens an external search and does not verify individual businesses or food preparation.

Print or save as PDF

Use the print action and show the browser print preview. If saving as PDF, confirm the content is legible and that no important itinerary section is clipped.

3. Evidence to Capture

- Homepage with trip form visible.
- Filled form before submission.
- Generated itinerary with day-wise activities.
- Saved Trips list and selected trip.
- Hotels & Restaurants search controls.
- Google Maps search result opened externally.
- Print preview or exported itinerary PDF.
- Health endpoint or deployment page, if required by the rubric.

4. Demonstration Integrity

Only show capabilities that are actually working. If a feature is unavailable, label it as planned or pending. Do not display environment files, API keys, database credentials or personal browser content during the recording.

5. Post-Demonstration Tasks

Review the recording for audio quality, screen readability and accidental secret exposure. Upload it to the required platform, set the appropriate access permissions, and add the final link to the submission only after verifying that the link opens for reviewers.
