Project Demo Planning

Phase 8: Project Demonstration

1. Preparation Strategy

A reliable demonstration depends on preparing the environment and sample data before recording. The goal is to reduce avoidable delays while preserving a truthful view of the application. Test the deployed app immediately before recording, especially the backend health endpoint and the main generation workflow.

2. Suggested Run of Show

Opening — 30 seconds

Introduce Trip Genius AI and explain that it generates a personalized itinerary draft from travel preferences.

Trip form — 45 seconds

Show the main inputs and explain how destination, dates, budget, group size, interests and travel style influence the request.

Itinerary — 75 seconds

Generate a plan and show the day-wise activities, cost estimates and travel tips. Mention that users should independently verify travel facts and costs.

Saved Trips — 45 seconds

Open the saved-trip list and demonstrate retrieving a trip. Show deletion only with a test record.

Place search — 45 seconds

Open a hotel or restaurant search and demonstrate that it leads to Google Maps. Explain the boundary of the integration.

Print and close — 45 seconds

Open print preview and conclude with the architecture, current limitations and planned improvements.

3. Technical Checklist

- Confirm frontend deployment loads.
- Confirm backend /health responds.
- Verify that the frontend points to the correct backend URL.
- Prepare a sample trip and know the expected output sections.
- Check audio input and screen recording resolution.
- Close notifications and unrelated windows.
- Ensure no secrets are visible.
- Keep screenshots as backup evidence.

4. Contingency Plan

If the AI provider fails or the deployed backend is unavailable, do not pretend the live action succeeded. Capture the error if useful, explain the dependency, and use a screenshot of a previously generated result only as supplementary evidence. Retry later if the evaluation requires a live run.

5. After Recording

Watch the complete recording once. Confirm that the audio is audible, cursor actions are visible, the text can be read, and no private credentials are exposed. Upload the final recording and test its access link in a separate browser session.
