Team Involvement in Demonstration

Phase 8: Project Demonstration

1. Purpose

This document describes how responsibilities can be organized during a project demonstration. It should reflect actual participation. The supplied project materials identify the project owner but do not establish a verified contribution breakdown for additional team members. Do not invent names or claim work that was not performed.

2. Single-Presenter Option

If the submission is individual, one presenter can introduce the problem, demonstrate the application, explain the architecture and summarize limitations. The same person can also prepare screenshots and verify the final video link. The documentation should explicitly state that a single presenter handled the demonstration rather than imply a team was present.

3. Multi-Presenter Option

If multiple contributors are officially part of the submission, divide the presentation into clear roles. One presenter can introduce the problem and user journey; a technical presenter can explain the API, AI service and database; and an evidence coordinator can ensure that screenshots, test results and links are ready. Assign names only after confirming actual responsibilities.

4. Suggested Responsibilities

Application walkthrough

The presenter should demonstrate the input form, itinerary generation, saved trips, external map search and print action in the planned order.

Technical explanation

The technical explainer should describe the frontend/backend boundary, model call, schema validation, Supabase persistence and deployment. They should be prepared to explain why the app uses Google Maps search URLs rather than claiming live listing data.

Evidence and submission

The evidence coordinator should check that screenshots are clear, test results are recorded, links are accessible and no secrets appear in the materials. The final video should be reviewed before submission.

5. Coordination Checklist

- Confirm the exact names and actual contributions of participants.
- Agree on the demo order and transition between speakers.
- Avoid repeated explanations of the same feature.
- Prepare a fallback screenshot if a live provider fails.
- Verify that all presenters understand the limitations and can answer questions.

6. Integrity Note

This template intentionally avoids asserting that a team meeting, rehearsal or assigned role has already occurred. Update it with factual details once the final presenter arrangement is confirmed.
